Módulo 1: De Anime a Live-Action — Guía Completa

Bienvenida y Qué Lograrás

Bienvenida al curso

This guide takes you from **zero** to **your first live-action shot, generated and ready to post**. No skimming: we walk through the only two moves that really matter, in order.

- **Part 1 — Generate your image.** Pick a scene, pull a reference image from it (the keyframe), and turn it into a realistic live-action visual.
- **Part 2 — Generate your video.** Take that image and bring it to life: camera, light, performance — without the AI falling apart.

This is the exact workflow I use every day at the studio. Nothing theoretical: you copy, you paste, you generate.

Complete beginners.

If you can download a video and copy-paste some text, you have the level. No editing or 3D skills are required for this first step.

El Principio en 30 Segundos

Anime → Live-action: cómo funciona

A video is a sequence of images. So you don't "convert" a scene in one go: you work **image by image**. The path is always the same.

- **You pick:** An anime clip that inspires you.
- **You extract:** A sharp still from the scene.
- **AI makes it real:** Part 1 of this guide.
- **AI animates it:** Part 2 of this guide.

This guide covers the two highlighted steps — **03** (generate the image) and **04** (generate the video). That's where 90% of the result is decided.

Tu Stack Mínimo

Una sola herramienta para empezar

Forget the list of 15 apps. For this first guide, all you need is this:

- **One all-in-one AI generation tool** — I work in **Higgsfield** (Nano Banana model for the image + built-in video generation). Alternative: TapNow / Seedance. The tool does the image *and* the video, so you stay in one place.
- **A way to grab a frame** — a video player and the screenshot key are enough to start.
- **A basic editor** — your phone's editing app is plenty for stitching your shots together.

Because color grading, upscaling and fps conversion are what separate a "fine" video from a "signature" one. We keep that for the advanced course. Here, we're aiming for your first clip **finished and posted**, not perfection.

Parte 1: Generar tu Imagen

Generar tu imagen

Choose a scene with a **strong composition**: a character facing forward or in profile, a striking wide shot, a gaze. For now, avoid shots packed with action or characters — the simpler it is, the more faithful the AI.

- Pause the video on the exact moment you want to recreate.
- Capture a **sharp** still (not during motion blur). That's your **keyframe**: the reference image.
- Keep good resolution — too small an image gives a mushy result.

In your tool, you have **three ways** to generate your live image. Click to explore each:

Tres Formas de Generar

A · Imagen → Live-action — la más simple

B · Imagen + referencia de personaje — para consistencia

C · Texto → Imagen — construir desde cero

Estructura de un Buen Prompt

A good prompt isn't a catch-all sentence. It's a **list of clear blocks**, from most important to least:

[Tabla de prompts]

Reference image = NEVER describe the character.

If you uploaded a reference of the face or character, don't describe it in the prompt (no hair, no outfit, no face). The reference is enough; describing it on top creates conflicts that distort the result. In that case, your prompt only holds the action, framing, light and mood.

Self-contained prompt.

Every prompt must stand on its own. The AI starts from scratch each generation: no "like the previous shot."
Everything that matters lives in THIS prompt.
